

# RDS RAILWAY DEFORMATION SYSTEM

The RDS (Railway Deformation System) is a system designed and developed for the automatic monitoring of railways.

RDS consists of a digital MEMS tiltmeter mounted parallel or transverse to the track. Micro-prisms can be installed on RDS-T gauges to integrate the system with optical monitoring.

RDS components are used to monitor settlement, heave, and twist of the track. The system is designed to be used on active tracks to ensure railway safety.

#### APPLICATIONS

- Monitors for possible deformations caused by nearby excavations
- Monitors for stability of temporary supports for railway tracks
- Monitors for safe operation in areas of possible settlement or heave

#### **FEATURES**

- Provides high accuracy with digital MEMS sensors
- Accommodates thermal expansion by telescopic joint
- Tolerates shock up to 20000 g
- Removes easily when reballasting is required

Meets the essential requirements of the EMC Directive 2014/30/UE

# TECHNICAL SPECIFICATIONS

PRODUCT CODE	0S7RDSHDT02	0S7RDSHDL00
Model	RDS-T: Transverse RDS gauge  The RDS-T consists of an aluminum sensor body with a steel anchor plate. It can be installed on concrete or wooden ties (sleepers). It is supplied with two 2 meter cables and waterproof connectors. The RDS-T is suitable for monitoring of railway tracks with temporary support (i.e. Essen method).	RDS-L: Longitudinal RDS gauge  The RDS-L consists of a MEMS tilt sensor mounted inside square-section aluminum tubing. The bar includes telescoping joint at one end, an optical target, and an anchor plate. The anchor plate is suitable for concrete ties (sleepers), and has extra mounting holes to allow for up to 150 mm variations in the distance between ties.
Measurement principle	uniaxial MEMS digital inclinometer	uniaxial MEMS digital inclinometer
Measuring range	±10° (±5° on request)	±10° (±5° on request)
Sensor repeatability	0.0013°	0.0013°
Sensor resolution	0.00056°	0.00056°
Sensor mechanical bandwidth	18 Hz	
Sensor stability @ 30 days (1)	<0.007°	<0.007°
Sensor accuracy: Lin. MPE <sup>(2)</sup> Pol. MPE <sup>(2)</sup>	<± 0.02% FS (±0.020 mm with ±10° range) <± 0.01% FS (±0.010 mm with ±10° range)	<± 0.02% FS (<±0.070 mm/m with ±10° range) <± 0.01% FS (<±0.035 mm/m with ±10° range)
Power supply	from 8 to 28 Vdc	from 8 to 28 Vdc

 $<sup>(1) \</sup> Measured\ stability\ after\ 30\ days,\ reference\ reading\ taken\ 24\ hours\ after\ installation.\ Test\ performend\ under\ nearly-repeatability\ conditions.$ 

<sup>(2)</sup> MPE is the Maximum Permitted Error on the measuring range (FSR). In the Calibration Report, the accuracies of the gauge are calculated using both linear regression ( $\leq$  Lin. MPE) and polynomial correction ( $\leq$  Pol. MPE)

<sup>(3)</sup> RS485 not-optoisolated Modbus communication with RTU Protocol Default output is sen alpha, other units available are degree, mm/m or inch/feet (to be requested at order). Sisgeo Modbus protocol manual is available for download here: <a href="https://www.sisgeo.com/uploads/manuali/SISGEO\_digitized\_instruments">https://www.sisgeo.com/uploads/manuali/SISGEO\_digitized\_instruments</a> - <a href="Modbus\_protocol\_specification\_EN\_04\_17.pdf">Modbus\_protocol\_specification\_EN\_04\_17.pdf</a>.

<sup>(4)</sup> Sensitivity is a specific parameter different for every gauge. The sensitivity is calculated during gauge calibration test and inserted into the Calibration Report.

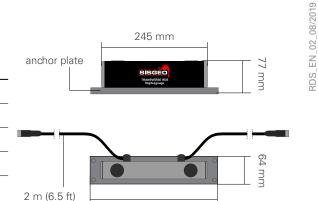

<sup>(5) 5</sup> m, 10 m and 15 m cables available on request

sensor cable

### RDS-T PHYSICAL FEATURES

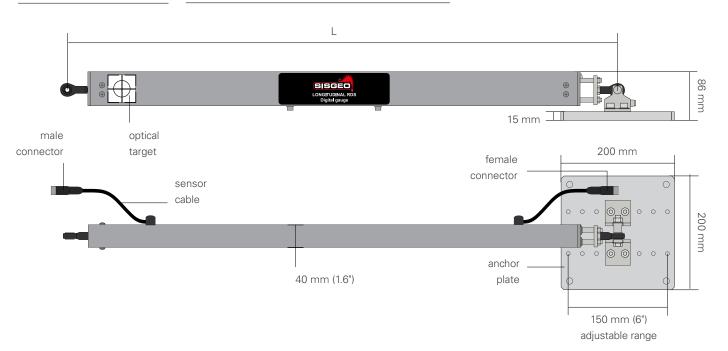

PRODUCT CODE	0S7RDSHDT02
Sensor body length	245 mm (9.6")
Total height	76.6 mm (3")
Installation plate	295 x 64 mm (11.6" x 2.5")
Materials	Aluminum body and steel plate

295 mm

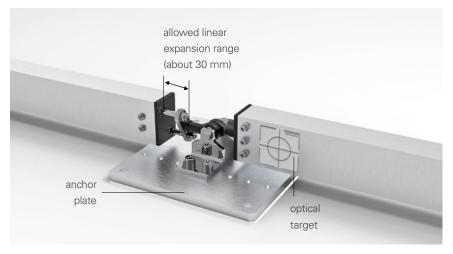

### RDS-L PHYSICAL FEATURES

PRODUCT CODE	0S7RDSHDL00	
Length (L)	1000, 2000 or 3000 mm (L) (3.25 ft, 6.5 ft, 9.8 ft )	
Total height	86 mm (3.4")	
Anchor plate	200 x 200 mm (8 x 8")	
Materials alluminum bar and steel plate		

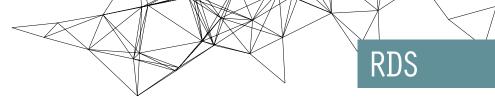

#### TELESCOPIC JOINT

Sisgeo developed a special telescoping joint for the RDS-L tubing. It accommodates thermal expansion of the aluminum bar to eliminate possible bending that would affect the sensor readings.

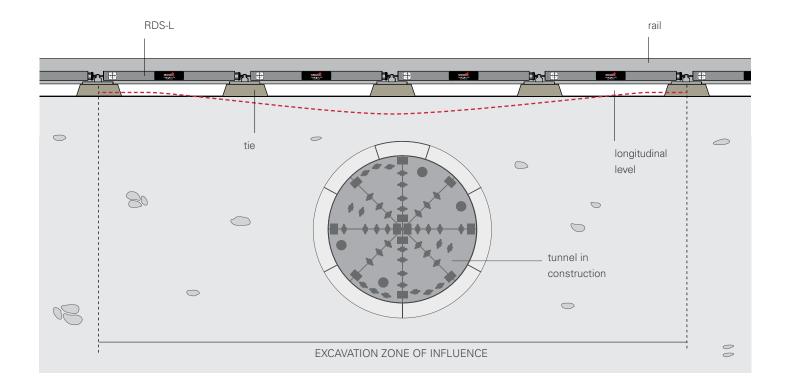

### RDS-L: LONGITUDINAL DEFORMATIONS

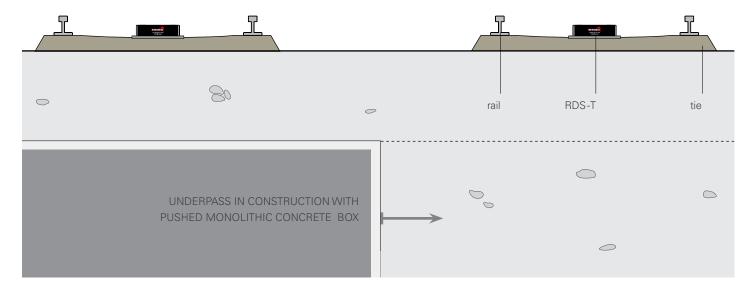

The RDS-L gauges are installed in continuous chain to monitor the longitudinal level of the tracks. The gauge mounting plates are anchored to the ties with screws or with special resin.

### RDS-T: TRANSVERSE DEFORMATION

The RDS-T are installed to monitor the inclination of the ties and consequentely the cant (or "skew") of the railway.

The twisting is usually expressed in ‰ as the relative inclination of one rail Vs the other.

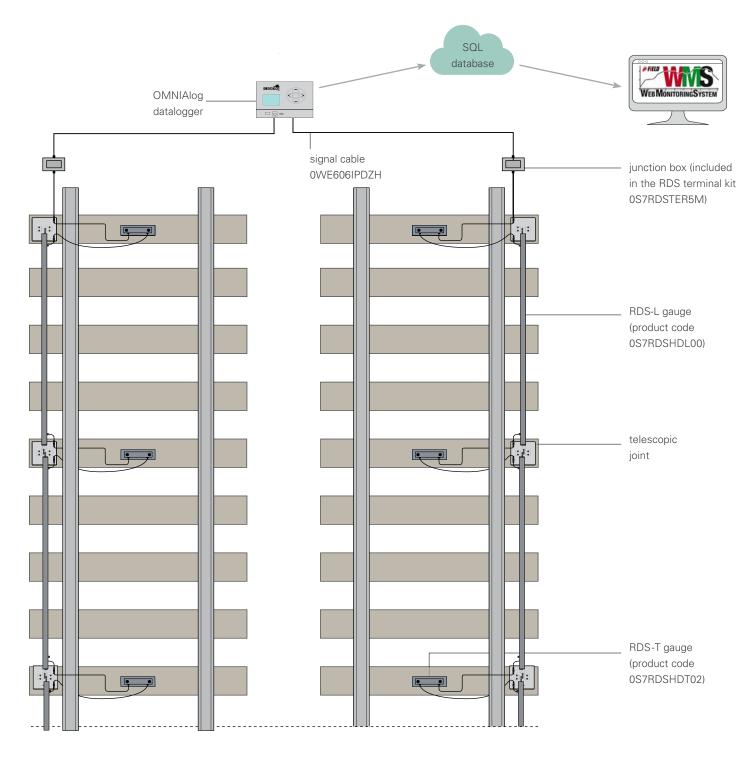

#### RDS SYSTEM

The RDS system consists of a number of RDS-L and RDS-T gauges spanning the entire area where track deformation may occurs. RDS-L are installed in continuous chain, and RDS-T are installed at preset intervals (usually 1 m, 3 m or 9 m). All the gauges connected to an RS-485 bus by waterproof 5-pin connectors. The RS-485 bus cable is terminated in the junction box included with the RDS terminal kit (0S7RDSTER5M). A digital cable 0WE606IPDZH carries the data from the junction box to an OMNIAlog datalogger. The OMNIAlog datalogger collects and sends RDS system data to an SQL database through GSM/GPRS modem, 3G/VPN router, fiber optic cable, radio or satellite interface. The web platform WMS (Web Monitoring System) validate, processes, converts, manages and publishes data on dedicated web pages, as requested by the user. RDS gauges are developed for easily removal when reballasting is required or when the system must be moved to a different location. The rugged RDS system tolerates hard weather and wide temperature ranges. All the components have IP67 protection minimum and a working temperature range of -30°C to +70°C. If the railway section to be monitored is very long, small errors may accumulate. In that case, the OPTICAL - RDS integrated system is recommended.

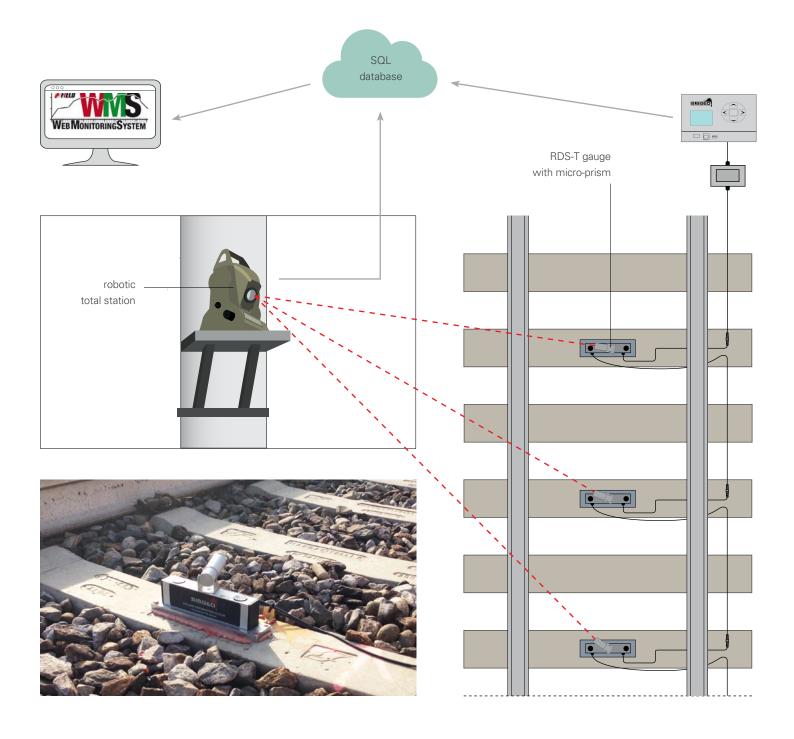

#### OPTICAL-RDS INTEGRATED SYSTEM

The OPTICAL - RDS integrated system consists of a number of RDS-T gauges, each with a micro prism for optical monitoring. The RDS-T gauges are usually installed on the sleepers at 1 m, 3 m or 9 m intervals. Longitudinal deformations are measured with an high-accuracy (0.5") robotic total station, able to detect the vertical position of the micro prism and, with processing, the settlement or heave of the tracks. Transverse deformations are monitored with the RDS-T gauges, all connected to an RS-485 bus by waterproof 5-pin connectors, and then to the OMNIAlog through a junction box and digital cable. Both the robotic total station and the OMNIAlog data logger collect and send data to an SQL database through GSM/GPRS modem, 3G/VPN router, fiber optic cable, radio or satellite interface. The web platform WMS (Web Monitoring System) validates, processes, converts, manages and publishes data on dedicated web pages, as requested by the customer. RDS-T gauges are developed for easily removal when reballasting is required or when the system must be moved to a different location. The OPTICAL - RDS integrated system is recommended when the monitored area is too long for RDS-L gauges. Optical systems are not recommended where there is heavy fog or rain. Also, it should be noted that microprisms must be cleaned monthly to remove dust created by train braking systems

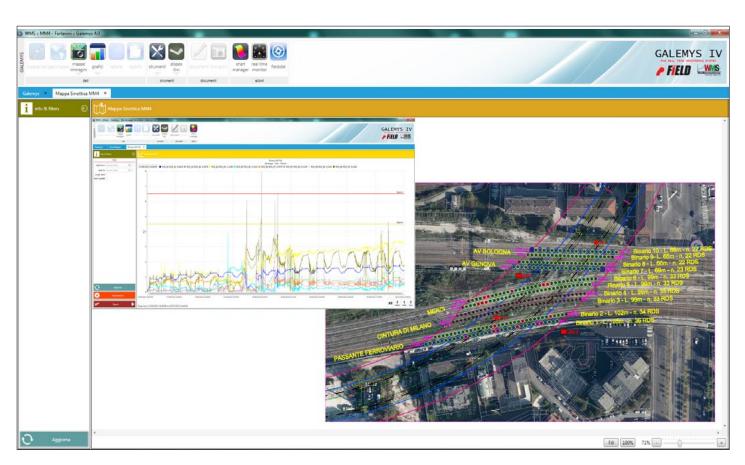

The WMS is a software platform designed and developed by Field Srl to validate, process, convert, compensate, manage, and automatically display data and graphs from geotechnical, structural, dynamic, meteorological and environmental monitoring systems.

OMNIAlog dataloggers and robotic total stations, equipped with any communication inteface, send data to a remote server. The server then validates the data, removing spikes and anomalous readings, and processes the readings, converting them to engineering units, and finally adding them to its SQL database. The readings are then made available in the form of charts or tables through the "Galemys" application. The entire process is automated so that current data is available 24 hours a day, 7 days a week.

The charts are completely dynamic and can be configured by the user (colour, width, and visual characteristics of curves), the .xlsx files can be downloaded, and the status of instruments can be viewed through interactive tables or maps.

If a reading value exceeds a preset alarm thresholds, the WMS can send an alarm notification via SMS or e-mail to the mobile phones of registered users.

WMS can be configured to show any RDS information needed by the customer. For further information, visit the dedicated web page on the Field Srl web site <a href="https://www.fieldsrl.it/wms">www.fieldsrl.it/wms</a>.

This WMS screen shot shows the position of the RDS gauges on job site with nine tracks where an underpass is being constructed. The plot represents the railway twisting. Alert and alarm thresholds are represented by straight yellow and red lines.

# ACCESSORIES AND SPARE PARTS

# RDS-L TERMINAL ANCHOR PLATE OS7RDSOOLEO

Anchor plate used to terminate the RDS-L chain. It accommodates 150 mm of length adjustment, just as other anchor plates.

## DIGITAL SIGNAL CABLE OWE606IPD2H

Used to connect the junction box of the RDS terminal kit to the datalogger. Cable has three twisted pairs (4x0.22 mm², 2x2.0 mm²).

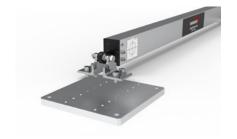

# RESISTANCE ENDING DEVICE OETERMRESIO

Termination resistance with connector, needed to close every digital RDS chain. The value of resistor depends on the layout of each system.

For more detail see the FAQ#076.

## RDS-L SPARE ANCHOR PLATE OS7RDSOOLSP

Used when an RDS-L must be moved to a new location, and its anchor plate cannot be moved with it.

# PLATE FOR WOODEN TIES OS7RDSOOLWP

Steel anchor plate for mounting RDS-L

## RDS TERMINAL KIT OS7RDSTER5M

Includes 5 m digital cable with waterproof connector to connect the closest RDS gauge and junction box.

# RDS-T SPARE ANCHOR PLATE OS7RDSOOTSP

Used when an RDS-T must be moved to a new location, and its anchor plate cannot be moved with it.
